Remarks: This is a planned water spreading system. The ditches are placed on grades across the slope. Water is picked up at the diversion points at the beginning of each ditch and sometimes at other points on the ditches. Water will be let out of the ditches at various intervals to flow into the ground. This system will pickup early spring run-off from intermittent drainages which are eroding the meadow areas of Cox flat and will be used as part of the irrigation supply. The owner will have to take water from areas and it will flow through the system and return to Thomas Creek.
