Instructions for the Additional Water Rights Form

When Do I Use This Form?

This form is used to accompany the "Standard Lease Form" when more than one water right is being leased instream. One "Additional Water Rights Information Form" should be used for each additional right being leased instream.

Instructions for Completing a this Form

1.5 Complete a water right profile for each right, or portion of a right proposed to be leased for instream use. The priority date, type of use, and other information describing the right will be found on your certificate, which can be viewed online at http://stamp.wrd.state.or.us/apps/wr/wrinfo/wrinfo.php. (Note: Profiles of supplemental rights are required only when these rights are also proposed to be leased.)

"Priority date" should include the day and month, if applicable, in addition to the year.

If the entire water right is being leased, check the "Yes" box indicating this and skip to the number of acres being leased.

If the entire water right is <u>not</u> being leased, check the "No" box indicating this and fill in the remainder of Section 1.5.

"Acre-feet of storage" is the quantity of water that is released from a reservoir. If no reservoir is involved, indicate "N/A."

"Maximum rate associated with leased rights" should show the total rate of use. For example, if 40 acres are being leased instream and the rate is described as 1/80 cfs/acre, then the rate would be 0.5 cfs (40 acres * 1/80 cfs/acre).

"Maximum duty associated with leased rights" should show the total duty. For example, if 40 acres are being leased instream and there is a 4 ac-ft duty per acre the maximum duty would be 160 ac-ft (40 acres * 4.0 ac-ft/ac). If no duty is listed on the certificate or in the decree, then "N/A" should be indicated.

Attachment 3, a detailed map illustrating lands under subject rights to be leased, is required if only part of a right is being leased instream. If a map is Instructions Page 1 required it needs to include the Township, Range, Section, ¹/₄ ¹/₄, a north arrow, scale and crosshatching or other photocopiable means of differentiating the lands being leased from the remaining lands.

2.2 This section is best completed in close consultation with the local district watermaster (a listing is available at

http://www.wrd.state.or.us/staff/index.shtml), who will be responsible for making a number of decisions relating to the reach, amount, timing, and duration of the instream use. Variables among water rights include:

- The way in which use under the right is distributed throughout the season.
- Use allowed during a certain period of the year only.
- Specific provisions relating to total volume and rate.
- Particular conditions of individual rights, which will also apply to the new use.

The watermaster will:

- Review factors such as losses, return flow, and consumptive use in determining whether the proposed location of the new use will be allowed.
- Decide if and how far the Department can protect the new instream use past the original point of diversion. (In some instances, the new use may need to be broken into reaches of decreasing amounts. The reach below the original point of diversion would be managed like the shepherding of stored water.)
- Identify any conditions to be placed on the new use, which are necessary to prevent or mitigate injury to existing rights.

If a water right is used at its maximum rate for the entire season, it will frequently exceed its allowable duty (volume), and/or need to have the season of use reduced to prevent enlargement or injury of other water rights.

Do not include with lease application.
