Groundwater Application Review Summary Form

Application # G- 19027
GW Reviewer <u>Joe Kemper</u> Date Review Completed: <u>6/13/2023</u>
Summary of GW Availability and Injury Review:
Groundwater for the proposed use is either over appropriated, will not likely be available in the amounts requested without injury to prior water rights, OR will not likely be available within the capacity of the groundwater resource per Section B of the attached review form.
Summary of Potential for Substantial Interference Review:
\square There is the potential for substantial interference per Section C of the attached review form.
Summary of Well Construction Assessment:
☐ The well does not appear to meet current well construction standards per Section D of the attached review form. Route through Well Construction and Compliance Section.
This is only a summary. Documentation is attached and should be read thoroughly to understand the basis for determinations and for conditions that may be necessary for a permit (if one is issued).

WATER RESOURCES DEPARTMENT

MEM	O	June 13, 2023_
TO:		Application G- <u>19027</u>
FROM	M:	GW: _Joe Kemper_ (Reviewer's Name)
SUBJ	ECT: S	cenic Waterway Interference Evaluation
\boxtimes	YES	The source of appropriation is hydraulically connected to a State Scenic
	NO	Waterway or its tributaries
\boxtimes	YES	
	NO	Use the Scenic Waterway Condition (Condition 7J)
_		
	interfer	RS 390.835, the Groundwater Section is able to calculate ground water rence with surface water that contributes to a Scenic Waterway. The calculated rence is distributed below
	interfer Depart propos	RS 390.835, the Groundwater Section is unable to calculate ground water rence with surface water that contributes to a scenic waterway; therefore , the the the third that there is a preponderance of evidence that the sed use will measurably reduce the surface water flows necessary to be the free-flowing character of a scenic waterway.

DISTRIBUTION OF INTERFERENCE

Calculate the percentage of consumptive use by month and fill in the table below. If interference cannot be calculated, per criteria in 390.835, do not fill in the table but check the "unable" option above, thus informing Water Rights that the Department is unable to make a Preponderance of Evidence finding.

Exercise of this permit is calculated to reduce monthly flows in <u>Rogue</u> Scenic Waterway by the following amounts expressed as a proportion of the consumptive use by which surface water flow is reduced.

iii. □ The permit should contain special condition(s) as indicated in item 3 below; a. □ Condition to allow groundwater production from no deeper than		i.
a. Condition to allow groundwater production from no deeper than		ii. The permit should be conditioned as indicated in item 2 below.
b. Condition to allow groundwater production from no shallower than ft. below land surface; c. Condition to allow groundwater production only from the ft. and ft. below land surface; d. Well reconstruction is necessary to accomplish one or more of the above conditions. The problems that are likely to occur with this use and without reconstructing are cited below. Without reconstruction, I recommend withholdin issuance of the permit until evidence of well reconstruction is filed with the Department and approved by the Groundwater Section. Describe injury —as related to water availability—that is likely to occur without well reconstruction (interference w/ senior water rights, not within the capacity of the resource, etc): Groundwater availability remarks: The applicant's well encounters —20 feet of alluvium, then accesses an aquifer hosted in fractured diorite of the Grayback Pluton. Water in this aquifer is typically stored and transmitted in secondary fractures/fissures, and not the rocks' primary porosity. Well yields in the area are low to moderate (median yield reported fo TRS 388/5W-s22 = 30 gpm), and water levels are predominately shallow (<25 feet). There are several OWRD observation wells that access the target aquifer in the Williams area, which show predominately shallow water levels with 10-20 feet of seasonal fluctuation. Most of these observation wells display stable long-term trends. While JOSE 60782, JOSE 1978, and JOSE 1979 show some interannual fluctuations, those records do not display excessive declines or excessively declining trends. There is not a preponderance of evidence that the target aquifer is over-appropriated. Groundwater development is relatively high in the Williams area and acutely near the proposed well. The proposed use pose: the risk of injury to the well JOSE 10481 under Certificate 66522 is located approximately 650 feet to the NE. Well-to-well interference is estimated, using a Theis distance drawdown model, to be less than 5-10 feet after full		iii. \square The permit should contain special condition(s) as indicated in item 3 below;

C. GROUNDWATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040** (1): Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	Fractured Bedrock of Grayback Pluton		

Basis for aquifer confinement evaluation: In fractured-bedrock aquifer systems, water is stored and transmitted primarily by discrete but connected fracture sets. These fractures generally extend to near the surface, so water within these fractures is likely under atmospheric pressure (unconfined) despite an overall low storage coefficient for the aquifer system as a whole and static water levels often reported above water-bearing zones on driller's logs.

C2. **690-09-040** (2) (3): Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)		Čonne	lically cted? ASSUMED	Potentia Subst. In Assum	terfer. ed?
			Tt IIISI	10 11151		125	110	1200 01/122	YES	NO
1	1	Horsehead Creek	1476	1315	375		\boxtimes			\boxtimes
1	2	Williams Creek	1476	1295	6250	X				\boxtimes

Basis for aquifer hydraulic connection evaluation: Groundwater levels are higher than Williams Creek, indicating that groundwater is flowing towards and discharging to surface water. Available information (total contributing area, aerial imagery, lidar DEM, fish surveys, and historic mapping) indicates that Horsehead Creek is predominately fed by recent precipitation as opposed to groundwater and, thus, is not considered to be a surface water source that is hydraulically connected to groundwater.

Water Availability Basin the well(s) are located within: WILLIAMS CR > APPLEGATE R - AT MOUTH

C3a. **690-09-040 (4):** Evaluation of stream impacts for <u>each well</u> that has been determined or assumed to be **hydraulically connected and less than 1 mile** from a surface water (SW) source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that SW source, not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% *natural* flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked ⊠ box indicates the well is assumed to have the potential to cause PSI.

Well	SW #	Well < 1/4 mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?

C3b. **690-09-040 (4):** Evaluation of stream impacts <u>by total appropriation</u> for all wells determined or assumed to be **hydraulically connected and less than 1 mile** from a surface water source. **Complete only if Q is distributed among wells.** Otherwise same evaluation and limitations apply as in C3a above.

	SW #	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
ĺ									

Comments: There are no hydraulically connected surface water sources within one mile of the applicant's well, so the above metrics do not apply.

C4a. **690-09-040 (5):** Estimated impacts on **hydraulically connected surface water sources greater than one mile** as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.

(A) = total interference as CFS; (B) = WAB calculated natural flow at 80% exceed. as CFS; (C) = 1% of calculated natural flow at 80% exceed. as CFS; (D) = highlight the checkmark for each month where (A) is greater than (C); (E) = total interference divided by 80% flow as percentage.

Basis for impact evaluation: Stream depletion to Williams Creek is estimated using the Hunt (1999) analytical model using parameters representative of bulk aquifer properties. A pumping rate of 0.024 cfs is used to represent the total volume of water

	that would be pumped from JOSE 9971 under G-19027 and Certificate 66521 (17.5 AF) pumped over 365 days.
C4b.	690-09-040 (5) (b) The potential to impair or detrimentally affect the public interest is to be determined by the Water Rights Section.
С5. [If properly conditioned, the surface water source(s) can be adequately protected from interference, and/or groundwater use under this permit can be regulated if it is found to substantially interfere with surface water:
_	Rights Section. If properly conditioned, the surface water source(s) can be adequately protected from interference, and/or groundwa

ii. The permit should contain special condition(s) as indicated in "Remarks" below;

SW / GW Remarks and Conditions: The applicant's well accesses an aquifer that is determined to be hydraulically conn to Williams Creek. The Division 9 review is done considering both the requested rate under application G-19027 and the cut Certificate 66521 (see table below). There is not a preponderance of evidence that the proposed use has the Potential for Substantial Interference (PSI) as per OAR 690-009. D. WELL CONSTRUCTION, OAR 690-200

D1.	Well #:	Logid:						
D2.	THE WELL does not appear to meet current well construction standards based upon:							
	a. \square review	of the well log;						
	b. \square field ins	spection by	;					
		of CWRE						
		specify)						
D3.		nstruction deficiency or other comment is described as follows:						
D4. [Route to the W	Vell Construction and Compliance Section for a review of existing well construction	n.

Distance Drawdown Modeling (Theis, 1935)

Theis Time-Drawdown Worksheet

v.3.00

Calculates Theis nonequilibrium drawdown and recovery at any arbitrary radial distance, r, from a pumping well for 3 different T values and radial distance, r, from a pumping well for 3 different T values and 2 different S values.

Written by Karl C. Wozniak September 1992. Last modified December 17, 2019

Input Data:	Var Name	Scenario 1	Scenario 2	Scenario 3	Units		
Total pumping time	t		126		d		
Radial distance from pumped well:	r		650		ft	Q conversions	
Pumping rate	Q		0.04		cfs	17.95 gpm	
Hydraulic conductivity	K	1	3.2	10	ft/day	0.04 cfs	
Aquifer thickness	b		100		ft	2.40 cfm	
Storativity	S_1		0.0001			3,456.00 cfd	
	S_2		0.00001			0.08 af/d	
Transmissivity Conversions	T_f2pd	100	320	1000	ft2/day	,	
	T_ft2pm	0.0694444	0.2222222	0.6944444	ft2/min	Recalculate	
	T_gpdpft	748	2393.6	7480	gpd/ft		

Use the Recalculate button if recalculation is set to manual

Date: 6/13/2023
