B. GROUND WATER AVAILABILITY CONSIDERATIONS, OAR 690-310-130, 400-010, 410-0070

Bas	sed upon available data, I have determined that ground water* for the proposed use:
a.	is over appropriated, is not over appropriated, or is cannot be determined to be over appropriated during any period of the proposed use. * This finding is limited to the ground water portion of the over-appropriation determination as prescribed in OAR 690-310-130;
b.	■ will not or ■ will likely be available in the amounts requested without injury to prior water rights. * This finding is limited to the ground water portion of the injury determination as prescribed in OAR 690-310-130;
c.	will not or will likely to be available within the capacity of the ground water resource; or
d.	will, if properly conditioned, avoid injury to existing ground water rights or to the ground water resource: i. The permit should contain condition #(s) 7B, 7C, large water-use reporting; ii. The permit should be conditioned as indicated in item 2 below. iii. The permit should contain special condition(s) as indicated in item 3 below;
a.	Condition to allow ground water production from no deeper than ft. below land surface;
b.	Condition to allow ground water production from no shallower than ft. below land surface;
c.	★ Condition to allow ground water production only from the water reservoir between approximately ft. and ft. below land surface;
d.	 ■ Well reconstruction is necessary to accomplish one or more of the above conditions. The problems that are likely to occur with this use and without reconstructing are cited below. Without reconstruction, I recommend withholding issuance of the permit until evidence of well reconstruction is filed with the Department and approved by the Ground Water Section. Describe injury —as related to water availability—that is likely to occur without well reconstruction (interference w/
	senior water rights, not within the capacity of the resource, etc):
und san Wil grawel rela incr app sub con opii inte	derlain by about 100 feet mixed-grained sediments. Columbia River Basalt occurs at a depth of about 200 feet. A wedge of d and gravel beneath the Willamette Silt thickens to the east but thins dramatically to the west. This is probably an old llamette River channel which is inset into relatively fine-grained sediments. Within the old channel deposits sands and vels predominate and well yields and specific capacities are high; outside of the channel, silts and clays predominate and ll yields and specific capacities are much lower. Long-term water-level trends in a nearby observation well (MARI 308) are actively stable with a subdued correlation to decadal climate trends. Seasonal water-level fluctuations however, have reased to about 65 feet compared to about 40 feet prior to 1985. The increased seasonal fluctuations correlate to increased propriation from the local aquifer system. The aquifer can probably sustain some additional development but any estantial increase in seasonal fluctuations (>20 feet) is likely to have adverse impacts on nearby wells. Because of the implex aquifer geometry, it is difficult to predict what level of additional stress will produce this response. Our general nion is that the current application is not likely to have that large of an impact. However, decline and hydraulic efference conditions are warranted by the underlying uncertainties. A water-use reporting condition is necessary to gage the pact on our nearby observation well which, in turn, will allow us to more effectively evaluate impacts to nearby wells and more effectively evaluate the capacity of the local aquifer system.

C. GROUND WATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040** (1): Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	Alluvium		

Basis for aquifer confinement evaluation: General knowledge indicates that the water table occurs at shallow depths in the Willamette Silt which confines the underlying sand and gravel aquifer.

C2. **690-09-040 (2) (3):** Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)	Hydraulically Connected? YES NO ASSUMED	Potential for Subst. Interfer. Assumed? YES NO
1	1	Ryan Creek	150	85-120	2500		
1	2	Yergen Creek	150	100-120	3900		
1	3	Willamette River	150	55	5600		

basis for aquiter nyuraulic connection evaluation: Publ	dished water table maps indicate that groundwater flows toward and
discharges into local streams.	
Water Availability Basin the well(s) are located within:	Willamettte R > Columbia R - AB Molalla R

C3a. 690-09-040 (4): Evaluation of stream impacts for <u>each well</u> that has been determined or assumed to be hydraulically connected and less than 1 mile from a surface water source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that surface water source, and not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% natural flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked box indicates the well is assumed to have the potential to cause PSI.

Well	SW #	Well < 1/4 mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
1	1						3830		<<25%	
1	2						3830		<<25%	

Date: November 7, 2011

C3b. 690-09-040 (4): Evaluation of stream impacts by total appropriation for all wells determined or assumed to be hydraulically connected and less than 1 mile from a surface water source. Complete only if Q is distributed among wells. Otherwise same evaluation and limitations apply as in C3a above.

 traidation and immattons apply as in est above.												
SW #		Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?			

Comments: Interference at 30 days was not modeled but modeling in similar circumstances shows that the presence of a thick
layer of Willamette Silt between the streams and the productive sand and gravel beds is likely to keep interference well below
<u>25%.</u>

C4a. **690-09-040 (5):** Estimated impacts on hydraulically connected surface water sources greater than one mile as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.

Application G-17482 Date: November 7, 2011 Page 6 D. WELL CONSTRUCTION, OAR 690-200 Logid: D1. THE WELL does not meet current well construction standards based upon: D2. review of the well log; field inspection by report of CWRE _____ d. other: (specify) D3. THE WELL construction deficiency: a.

constitutes a health threat under Division 200 rules; commingles water from more than one ground water reservoir; permits the loss of artesian head; permits the de-watering of one or more ground water reservoirs; d. other: (specify) THE WELL construction deficiency is described as follows: D4. D5. a. was, or was not constructed according to the standards in effect at the time of THE WELL original construction or most recent modification. b. I don't know if it met standards at the time of construction. D6. Route to the Enforcement Section. I recommend withholding issuance of the permit until evidence of well reconstruction is filed with the Department and approved by the Enforcement Section and the Ground Water Section. THIS SECTION TO BE COMPLETED BY ENFORCEMENT PERSONNEL D7. Well construction deficiency has been corrected by the following actions:

(Enforcement Section Signature)

D8. Route to Water Rights Section (attach well reconstruction logs to this page).
