Application G-18112 Date: December 15, 2015 Page 3

C. GROUNDWATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040** (1): Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	Bedrock		\boxtimes

Basis for aquifer confinement evaluation:

PSI.

Groundwater flow systems in the Clarno volcanics are presumably in secondary fractures which are likely semi-confined, given the reported age of the material. Well logs for some nearby wells (up to 13 miles away in a straight line up the Crooked River) report static water levels above the water bearing zones (CROO 2841, CROO 459, and CROO 336), indicating confined conditions. The well log for CROO 2825 (~4.5 miles down the Crooked River) reports a static water level roughly equal to the depth at which water was first encountered, indicating the flow system is likely unconfined, at least locally. Nearby domestic wells (CROO 2827 and CROO 2828) were constructed to produce water from both a shallow alluvial aquifer and flow zones within the bedrock aquifer, so it is difficult to determine if locally the bedrock is confined, semi-confined, or unconfined.

Given the variability of groundwater flow systems within the Clarno Formation, and the fact that the orientation of existing fractures is unknown, it is difficult to predict what will be encountered if a well is drilled at this location.

C2. **690-09-040** (2) (3): Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)	Iydraul Connec NO A	•	Potentia Subst. In Assum YES	terfer. ed? NO
1	1	Drake & Wildcat Creeks	~3450	3400- 3722	1320				\boxtimes
1	2	Crooked River	~3450	3392- 3408	2535				

Basis for aquifer hydraulic connection evaluation: The elevation of the hydraulic head in nearby wells is coincident or	
above the surface water elevation. The Crooked River likely represents a regional hydrologic sink.	
Water Availability Basin the well(s) are located within: 70353: CROOKED R> DESCHUTES R- AB SAND CR	

C3a. **690-09-040** (4): Evaluation of stream impacts for <u>each well</u> that has been determined or assumed to be **hydraulically** connected and less than 1 mile from a surface water source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that surface water source, and not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% *natural* flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked \boxtimes box indicates the well is assumed to have the potential to cause

Well	SW #	Well < 1/4 mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
1	1			-	-		-		See

1	2			70353	47.80	\boxtimes	38.70	\boxtimes	See	\boxtimes
									comments	

Application G-18112

Page

Date: December 15, 2015

C3b. **690-09-040 (4):** Evaluation of stream impacts by total appropriation for all wells determined or assumed to be hydraulically connected and less than 1 mile from a surface water source. Complete only if Q is distributed among wells. Otherwise same evaluation and limitations apply as in C3a above.

SW #	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?

Comments: Pumping from the well will likely impact surface water along the creeks and the Crooked River. However, the	
nature of the aquifer system precludes the use of available analytical models to evaluate the timing of interference.	

C4a. **690-09-040 (5):** Estimated impacts on **hydraulically connected surface water sources greater than one mile** as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.
