

Groundwater Application Review Summary Form

Application # G- 18629

GW Reviewer Ben Scardella, Dennis Orlovski Date Review Completed: 6/28/18

Summary of GW Availability and Injury Review:

Groundwater for the proposed use is either over appropriated, will not likely be available in the amounts requested without injury to prior water rights, OR will not likely be available within the capacity of the groundwater resource per Section B of the attached review form.

Summary of Potential for Substantial Interference Review:

There is the potential for substantial interference per Section C of the attached review form.

Summary of Well Construction Assessment:

The well does not appear to meet current well construction standards per Section D of the attached review form. Route through Well Construction and Compliance Section.

This is only a summary. Documentation is attached and should be read thoroughly to understand the basis for determinations and for conditions that may be necessary for a permit (if one is issued).

MEMO

To: Kristopher Byrd, Well Construction and Compliance Section Manager
From: Joel Jeffery, Well Construction Program Coordinator
Subject: Review of Water Right Application G-18629
Date: August 28, 2018

The attached application was forwarded to the Well Construction and Compliance Section by Water Rights. Dennis Orłowski and Ben Scandella reviewed the application. Please see Dennis's and Ben's review and the well log.

Applicant's Well #1 (MULT 1580): Based on a review of the Well Report, Applicant's Well #1 does not appear to comply with current minimum well construction standards (See OAR 690 Division 210). The water supply well report does not indicate the amount bentonite used to fill the upper annular space and therefore there is no way to determine if the correct amount of bentonite was used. In order to meet minimum well construction standards, the well must be resealed with an approved grout.

My recommendation is that the Department **not issue** a permit for Applicant's Well #1 (MULT 1580) unless it is brought into compliance with current minimum well construction standards or information is provided showing that it is in compliance with current minimum well construction standards.

Bringing Applicant's Well #1 into compliance with minimum well construction standards may not satisfy hydraulic connection issues.

PUBLIC INTEREST REVIEW FOR GROUNDWATER APPLICATIONS

TO: Water Rights Section Date 6/28/2018
 FROM: Groundwater Section Benjamin Scandella, Dennis Orłowski
 Reviewer's Name
 SUBJECT: Application G- 18629 Supersedes review of _____
 Date of Review(s) _____

PUBLIC INTEREST PRESUMPTION; GROUNDWATER

OAR 690-310-130 (1) The Department shall presume that a proposed groundwater use will ensure the preservation of the public welfare, safety and health as described in ORS 537.525. Department staff review groundwater applications under OAR 690-310-140 to determine whether the presumption is established. OAR 690-310-140 allows the proposed use be modified or conditioned to meet the presumption criteria. **This review is based upon available information and agency policies in place at the time of evaluation.**

A. GENERAL INFORMATION: Applicant's Name: Columbia Holdings LLC c/o Peter Stott. County: Multnomah

A1. Applicant(s) seek(s) 0.32 cfs from 2 well(s) in the Willamette Basin,
Lower Willamette subbasin.

A2. Proposed use Irrigation (25.2 acres) Seasonality: March 1 through October 31

A3. Well and aquifer data (**attach and number logs for existing wells; mark proposed wells as such under logid**):

Well	Logid	Applicant's Well #	Proposed Aquifer*	Proposed Rate(cfs)	Location (T/R-S QQ-Q)	Location, metes and bounds, e.g. 2250' N, 1200' E fr NW cor S 36
1	MULT 1580	1	Alluvial	0.32	2N1W-4 NE-SE	1830' N, 740' W fr SE cor S4

2	20		N/A	N/A	100	0-25	0-100	None	None			

Use data from application for proposed wells.

A4. **Comments:** The applicant's wells are located near the center of Sauvie Island, just south of the southern tip of Sturgeon Lake. The applicant states, "For Proposed Well 2, the well specification provided in the table below are estimates and subject to change based on actual conditions encountered in the field. The objective will be to construct the well to develop water from the alluvial aquifer."

A5. **Provisions of the** Willamette (OAR 690-502) Basin rules relative to the development, classification and/or management of groundwater hydraulically connected to surface water are, or are not, activated by this application. (Not all basin rules contain such provisions.)

Comments The applicant's proposed wells are located farther than 1/4 mile from both the Willamette River and Multnomah Channel, so the pertinent basin rules do not apply (OAR 690-502-0240).

A6. **Well(s) #** _____, _____, _____, _____, _____, tap(s) an aquifer limited by an administrative restriction.

Name of administrative area: _____

Comments: _____

B. GROUNDWATER AVAILABILITY CONSIDERATIONS, OAR 690-310-130, 400-010, 410-0070

B1. Based upon available data, I have determined that groundwater* for the proposed use:

- a. is over appropriated, is not over appropriated, or cannot be determined to be over appropriated during any period of the proposed use. * This finding is limited to the groundwater portion of the over-appropriation determination as prescribed in OAR 690-310-130;
- b. will not or will likely be available in the amounts requested without injury to prior water rights. * This finding is limited to the groundwater portion of the injury determination as prescribed in OAR 690-310-130;
- c. will not or will likely to be available within the capacity of the groundwater resource; or
- d. will, if properly conditioned, avoid injury to existing groundwater rights or to the groundwater resource:
 - i. The permit should contain condition #(s) 7n (annual meas.), medium water-used reporting;
 - ii. The permit should be conditioned as indicated in item 2 below.
 - iii. The permit should contain special condition(s) as indicated in item 3 below;

- B2.
- a. Condition to allow groundwater production from no deeper than _____ ft. below land surface;
 - b. Condition to allow groundwater production from no shallower than _____ ft. below land surface;
 - c. Condition to allow groundwater production only from the Alluvial groundwater reservoir between approximately _____ ft. and _____ ft. below land surface;
 - d. Well reconstruction is necessary to accomplish one or more of the above conditions. The problems that are likely to occur with this use and without reconstructing are cited below. Without reconstruction, I recommend withholding issuance of the permit until evidence of well reconstruction is filed with the Department and approved by the Groundwater Section.

Describe injury –as related to water availability– that is likely to occur without well reconstruction (interference w/ senior water rights, not within the capacity of the resource, etc): _____

B3. **Groundwater availability remarks:** Wells #1 obtains and #2 will obtain groundwater from water-bearing sand and gravel deposits of the Unconsolidated Sedimentary Aquifer (USA), which in this area has a total cumulative thickness of 200-300 feet (Swanson and others, 1993; Conlon and others, 2005). The general coincidence of local groundwater and surface water levels indicates hydraulic connection between the USA and the Columbia River system in this area.

Within approximately 2 miles of the proposed POA location there are about 10 wells completed in the alluvial aquifer with mostly irrigation and nursery groundwater rights, as well as a large municipal right, and several more exempt (domestic) wells also in the area. Reported maximum yields in the nearby alluvial wells range up to ~600 gpm, but are more typically on the order of 20-100 gpm.

Groundwater is likely available and not over-appropriated in this area due to the large storage capacity and permeability of the aquifer materials (primarily sand and gravel) and the high rate of recharge (Conlon and others, 2005). Recharge in this unconfined USA system comes from both precipitation and nearby surface water, especially due to the proximity and efficient hydraulic connection to the Multnomah Channel. While groundwater level data for aquifer wells in the area is not available over long periods to definitively determine the current state of the groundwater resource, the nearest well showing long-term data in the sedimentary aquifer system (COLU 3379, more than 10 miles to the north) is also probably hydraulically well-connected with local surface water and shows relative long-term stability for the past 50 years. Despite this conclusion, and because local groundwater data is nearly non-existent, the permit conditions noted in B1(d)(i) are recommended to provide additional information to support future understanding and management of the groundwater resource in this area. **If the applicants provide the well log or a well inspection report for Well #2 confirming that it is open to the same aquifer system as Well #1 (pending approval from an OWRD hydrogeologist), then due to the high transmissivity of the aquifer system and the close proximity and similar completion of all the wells, it would be sufficient to provide annual water level measurements from either of the 2 wells.**

C. GROUNDWATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040 (1):** Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	Alluvium	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2	Alluvium	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Basis for aquifer confinement evaluation: The well log for Well #1, as well as for nearby wells, shows water-bearing sand and gravel deposits overlain by 60-80 of low-permeability silt and clay. Locally, the aquifer tapped by some of these wells might be under semi-confined conditions. However, on Sauvie Island the overlying low-permeability deposits are not laterally extensive (Swanson and others, 1993; Conlon and others, 2005; Gannett and Caldwell, 1998). This characteristic, coupled with the efficient hydraulic connection between the USA and the Columbia River system, suggests that the USA is generally unconfined.

C2. **690-09-040 (2) (3):** Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)	Hydraulically Connected?			Potential for Subst. Interfer. Assumed?	
						YES	NO	ASSUMED	YES	NO
1	1	Mud Slough	0-10	5-20	1,900	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
1	2	Dairy Creek	0-10	10-20	4,200	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2	1	Mud Slough	0-10	5-20	2,100	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2	2	Dairy Creek	0-10	10-20	3,800	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Basis for aquifer hydraulic connection evaluation: Groundwater elevations were estimated using static water levels in the well log and land surface elevations for Well #1, and ranges of likely elevations were assumed based on those for Well #2. The similarity of elevations between groundwater and surface water, combined with the discontinuous nature of the low-permeability deposits overlying the USA, suggest that the alluvial aquifer is hydraulically connected to SW #1 and SW#2.

Water Availability Basin the well(s) are located within: None established

C3a. **690-09-040 (4):** Evaluation of stream impacts for each well that has been determined or assumed to be **hydraulically connected and less than 1 mile** from a surface water source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that surface water source, and not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% natural flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked box indicates the well is assumed to have the potential to cause PSI.

Well	SW #	Well < ¼ mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
1	1	<input type="checkbox"/>	<input type="checkbox"/>			<input type="checkbox"/>		<input type="checkbox"/>		<input type="checkbox"/>
1	2	<input type="checkbox"/>	<input type="checkbox"/>			<input type="checkbox"/>		<input type="checkbox"/>		<input type="checkbox"/>
2	1	<input type="checkbox"/>	<input type="checkbox"/>			<input type="checkbox"/>		<input type="checkbox"/>		<input type="checkbox"/>
2	2	<input type="checkbox"/>	<input type="checkbox"/>			<input type="checkbox"/>		<input type="checkbox"/>		<input type="checkbox"/>

C3b. **690-09-040 (4):** Evaluation of stream impacts by total appropriation for all wells determined or assumed to be **hydraulically connected and less than 1 mile** from a surface water source. **Complete only if Q is distributed among wells.** Otherwise same evaluation and limitations apply as in C3a above.

Well	SW #	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
		<input type="checkbox"/>			<input type="checkbox"/>		<input type="checkbox"/>		<input type="checkbox"/>

			<input type="checkbox"/>				<input type="checkbox"/>			<input type="checkbox"/>			<input type="checkbox"/>
			<input type="checkbox"/>				<input type="checkbox"/>			<input type="checkbox"/>			<input type="checkbox"/>
			<input type="checkbox"/>				<input type="checkbox"/>			<input type="checkbox"/>			<input type="checkbox"/>

Comments:

C3a: No WAB applies to the location of the applicant's wells, so they were not evaluated for potential for substantial interference.

C3b: Not applicable because well-specific rates were not specified.

C4a. **690-09-040 (5):** Estimated impacts on **hydraulically connected surface water sources greater than one mile** as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.

MEMO

To: Kristopher Byrd, Well Construction and Compliance Section Manager
From: Joel Jeffery, Well Construction Program Coordinator
Subject: Re-Review of Water Right Application G-18629
Date: October 15, 2018

The attached application was forwarded to the Well Construction and Compliance Section by Water Rights. Dennis Orłowski and Ben Scandella reviewed the application. Please see Dennis's and Ben's review and the well log.

Applicant's Well #1 (MULT 1580): Based on information obtained from an on-site well inspection, it has been determined that Applicant's Well #1 does not comply with current minimum well construction standards (See OAR 690 Division 210). The water supply well report does not indicate the amount bentonite used to fill the upper annular space and therefore in order to determine the adequacy of the bentonite seal a field inspection of the well was conducted. The results of the inspection reveal that the well seal, and the top terminal height, do not meet minimum well construction standards. In order to meet minimum well construction standards, the well must be resealed with an approved grout and the casing height of the well must be extended. My recommendation is that the Department **not issue** a permit for Applicant's Well #1 (MULT 1580) unless it is brought into compliance with current minimum well construction standards or information is provided showing that it is in compliance with current minimum well construction standards.

Bringing Applicant's Well #1 into compliance with minimum well construction standards may not satisfy hydraulic connection issues.
