## B. GROUNDWATER AVAILABILITY CONSIDERATIONS, OAR 690-310-130, 400-010, 410-0070

Ba	ased upon available data, I have determined that groundwater* for the proposed use:
a.	is over appropriated, is not over appropriated, or is cannot be determined to be over appropriated during any period of the proposed use. * This finding is limited to the groundwater portion of the over-appropriation determination as prescribed in OAR 690-310-130;
b.	will not or will likely be available in the amounts requested without injury to prior water rights. * This finding is limited to the groundwater portion of the injury determination as prescribed in OAR 690-310-130;
c.	$\square$ will not or $\square$ will likely to be available within the capacity of the groundwater resource; or
d.	will, if properly conditioned, avoid injury to existing groundwater rights or to the groundwater resource:  i.   The permit should contain condition #(s) 7C (7-yr SWL); 7J; Medium Water-use Reporting  ii.  The permit should be conditioned as indicated in item 2 below.  iii.  The permit should contain special condition(s) as indicated in item 3 below;
a.	Condition to allow groundwater production from no deeper than ft. below land surface;
b.	Condition to allow groundwater production from no shallower than ft. below land surface;
C.	Condition to allow groundwater production only from the groundwater reservoir between approximately ft. and ft. below land surface;
d.	Well reconstruction is necessary to accomplish one or more of the above conditions. The problems that are likely to occur with this use and without reconstructing are cited below. Without reconstruction, I recommend withholding issuance of the permit until evidence of well reconstruction is filed with the Department and approved by the Groundwater Section.
	<b>Describe injury</b> –as related to water availability– that is likely to occur without well reconstruction (interference w/ senior water rights, not within the capacity of the resource, etc):
<u>Th</u> thi	roundwater availability remarks:  ne applicant's POAs would produce from metasedimentary units of the Applegate Group. Well yields are typically low in its aquifer system; the median yield for wells in TRS 38S/2W-S27 is 10 gpm. There are no OWRD SWL measurements thin two miles of the proposed POA so groundwater over-appropriation cannot be determined.
Th so	nere are no groundwater POAs within 1 mile of the applicant's POAs and relatively few domestic well logs for 38S/2W-27 it is unlikely that the proposed use would injure adjacent senior water right holders.

_	

#### C. GROUNDWATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040** (1): Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	Bedrock of Applegate Group		
2	Bedrock of Applegate Group	$\square$	
3	Bedrock of Applegate Group		
4	Bedrock of Applegate Group	$\square$	
5	Bedrock of Applegate Group	$\boxtimes$	
6	Bedrock of Applegate Group	$\boxtimes$	

Basis for aquifer confinement evaluation: The well log for the applicant's Well 1 reports *First Water* at 50 feet BLS and a SWL of 26 feet below land surface indicating confined conditions. Well logs for nearby wells report similar confined conditions. The reviewer assumes that proposed wells will encounter similar hydraulic conditions.

C2. **690-09-040** (2) (3): Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)	Hydraulically Connected? YES NO ASSUMED	Potential for Subst. Interfer. Assumed? YES NO
1	1	Sterling Creek	3059	2695	> 1 mile		
2	1	Sterling Creek	*	2695	> 1 mile		
3	1	Sterling Creek	*	2695	> 1 mile		
4	1	Sterling Creek	*	2695	> 1 mile		
5	1	Sterling Creek	*	2695	> 1 mile		
6	1	Sterling Creek	*	2695	> 1 mile		
1	2	Griffin Creek	3059	2705	2725		
2	2	Griffin Creek	*	2705	2695		
3	2	Griffin Creek	*	2705	2720		
4	2	Griffin Creek	*	2705	2875		
5	2	Griffin Creek	*	<b>2710</b>	3000		
6	2	Griffin Creek	*	2710	3165		

Basis for aquifer hydraulic connection evaluation: Groundwater elevations are higher than nearby surface water sources, indicating that water is flowing towards and discharging to surface water. The proposed POAs are within the Sterling Creek WAB but could affect flow paths that would otherwise contribute to Griffin Creek

\*Wells are proposed, but the reviewer assumes the piezometric surface is similar to Well 1 (20-60 feet BLS).

Based on additional information considered in this re-review, including conversations with the local watermaster's office, review of historic aerial imagery, and consideration of the existing water rights in Sterling Creek in the vicinity of the applicant's proposed POAs, this re-review finds that the nearest point where Sterling Creek can be considered a viable surface water source for the purposes of OAR 690-009 rules is beyond 1 mile from the applicant's POAs. Findings related to hydraulic connection with Griffin Creek are not changed by this re-review.

Water Availability Basin the well(s) are located within: <u>LITTLE APPLEGATE R > APPLEGATE R - AT MOUTH</u> #70982; availability also evaluated for GRIFFIN CR > BEAR CR - AT MOUTH #71200

C3a. **690-09-040** (4): Evaluation of stream impacts for <u>each well</u> that has been determined or assumed to be **hydraulically** connected and less than 1 mile from a surface water source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that surface water source, and not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% *natural* flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked box indicates the well is assumed to have the potential to cause PSI.

Well	SW #	Well < 1/4 mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
1	2			IS71200A	0.4	$\boxtimes$	0.31	$\boxtimes$	**	$\boxtimes$
2	2			IS71200A	0.4	$\boxtimes$	0.31	$\boxtimes$	**	$\boxtimes$
3	2			IS71200A	0.4	$\boxtimes$	0.31	$\boxtimes$	**	$\boxtimes$
4	2			IS71200A	0.4	$\boxtimes$	0.31	$\boxtimes$	**	$\boxtimes$
5	2			IS71200A	0.4	$\boxtimes$	0.31	$\boxtimes$	**	$\boxtimes$
6	2			IS71200A	0.4	$\boxtimes$	0.31	$\boxtimes$	**	$\boxtimes$

C3b. **690-09-040 (4):** Evaluation of stream impacts by total appropriation for all wells determined or assumed to be **hydraulically connected and less than 1 mile** from a surface water source. **Complete only if Q is distributed among wells.** Otherwise same evaluation and limitations apply as in C3a above.

SW #	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?

Comments: \*\*Impacts of surface water could not be reliably estimated because the complex geology (high relief slopes, complex fractured bedrock aquifer) do not meet model assumptions of the widely accepted techniques for determining stream depletion (e.g., Hunt 1999, 2003).

C4a. **690-09-040 (5):** Estimated impacts on **hydraulically connected surface water sources greater than one mile** as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.

Non-D	istributed	Wells

$(\mathbf{E}) = (\mathbf{A}$	/ B) x 100	%	%	%	%	%	%	%	%	%	%	%	%

(A) = total interference as CFS; (B) = WAB calculated natural flow at 80% exceed. as CFS; (C) = 1% of calculated natural flow at 80% exceed. as CFS; (D) = highlight the checkmark for each month where (A) is greater than (C); (E) = total interference divided by 80% flow as percentage.

Basis for impact evaluation:	**Similarly to Section C3b, stream-depletion could	1 not be estimated. However, given the
distance between the POAs and	d the stream and appropriate aquifer parameters, stre	eam-depletion is likely less than 1% of the
	erennial streamflow for Sterling Cr.	
	· · · · · · · · · · · · · · · · · · ·	

Application G-18504 Date: 10/09/2018 5 Page 690-09-040 (5) (b) The potential to impair or detrimentally affect the public interest is to be determined by the Water Rights Section. C5. **If properly conditioned**, the surface water source(s) can be adequately protected from interference, and/or groundwater use under this permit can be regulated if it is found to substantially interfere with surface water: i. The permit should contain condition #(s) ii. The permit should contain special condition(s) as indicated in "Remarks" below; C6. SW / GW Remarks and Conditions: The applicant's wells would produce from an aquifer system that has been found to be hydraulically connected to adjacent surface water sources. The proposed rate, 0.1849 cfs, is larger than 1% of expected natural flows in Griffin Creek WAB. It is also larger than 1% of the instream water right for Griffin Creek. As a result, the proposed use is assumed to have the Potential for Substantial Interference (PSI) as per OAR 690-009. If the rate of appropriation were reduced to < 0.003 cfs (1900 gal/day) Division 9 rules would no longer require an automatic assumption of PSI. **References Used:** Hunt, B. 1999.
