Groundwater Application Review Summary Form

Application # G- 18825	
GW Reviewer Dhil Marcy Date Review Completed: 6/17/2019	
Summary of GW Availability and Injury Review:	
[] Groundwater for the proposed use is either over appropriated, will not likely be available in the amounts requested without injury to prior water rights, OR will not likely be available within the capacity of the groundwater resource per Section B of the attached review form.	
Summary of Potential for Substantial Interference Review:	
[] There is the potential for substantial interference per Section C of the attached review form.	
Summary of Well Construction Assessment:	
[] The well does not appear to meet current well construction standards per Section D of the attach	ied
review form Route through Well Construction and Compliance Section.	
This is only a summary. Documentation is attached and should be read thoroughly to understand the	e

This is only a summary. Documentation is attached and should be read thoroughly to understand the basis for determinations and for conditions that may be necessary for a permit (if one is issued).

B. GROUNDWATER AVAILABILITY CONSIDERATIONS, OAR 690-310-130, 400-010, 410-0070

B1.	Base	ed upon available data, I have determined that groundwater* for the proposed use:
	a.	is over appropriated, is not over appropriated, or cannot be determined to be over appropriated during any period of the proposed use. * This finding is limited to the groundwater portion of the over-appropriation determination as prescribed in OAR 690-310-130;
	b.	□ will not or □ will likely be available in the amounts requested without injury to prior water rights. * This finding is limited to the groundwater portion of the injury determination as prescribed in OAR 690-310-130;
	c.	\square will not or \square will likely to be available within the capacity of the groundwater resource; or
	d.	will, if properly conditioned, avoid injury to existing groundwater rights or to the groundwater resource: i. The permit should contain condition #(s) _7N, "Large Water Use Reporting"; ii. The permit should be conditioned as indicated in item 2 below. iii. The permit should contain special condition(s) as indicated in item 3 below;
B2.	a.	Condition to allow groundwater production from no deeper than ft. below land surface;
	b.	Condition to allow groundwater production from no shallower than ft. below land surface;
	c.	Condition to allow groundwater production only from the groundwater reservoir between approximately 1500+ ft. and ft. below land surface;
	d.	 Well reconstruction is necessary to accomplish one or more of the above conditions. The problems that are likely to occur with this use and without reconstructing are cited below. Without reconstruction, I recommend withholding issuance of the permit until evidence of well reconstruction is filed with the Department and approved by the Groundwater Section. Describe injury —as related to water availability—that is likely to occur without well reconstruction (interference w/ senior water rights, not within the capacity of the resource, etc):
В3.	mod later char unde acce 524 but r repo lack aqui risk	undwater availability remarks: The applicant proposes to develop "Basalt". In our current conceptual hydrogeologic el, rocks of the Columbia River Basalt Group (CRBG) provide a high degree of confinement, due to the presence of ally continuous lava flows that include dense interiors that are often tens of meters in thickness. Hydrologic acteristics of the PRV, which appear to be the targeted lithology of this proposed construction, are not as well erstood. Nearby UNIO 54215, constructed under permit G-17020, and UNIO 50684, constructed under permit G-15504, as both PRV and CRBG interflow zones, with no noted head difference between the two sequences. In the case of UNIO 15, the driller did note a head difference between the compound volcanic sequence and overlying sedimentary sequence, no difference was noted between the two volcanic sequences. In the case of UNIO 50684, two water-bearing zones are reted within each of the volcanic sequences, but no head measurements are reported on the driller's log. Therefore, ing any further information, an assessment of whether the CRB, PRV, or any combination of thereof comprises a single fer system is not possible. As a result, more information is needed to approve construction of a POA well that does not commingling discreet aquifers, and furthermore to establish a reasonable basis for the conclusion that hydraulic nection with surface water has been avoided.
	_	

Date: 06/17/2019

C. GROUNDWATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040** (1): Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	Powder River Volcanics		
2	Powder River Volcanics	\boxtimes	
3	Powder River Volcanics	\boxtimes	

Basis for aquifer confinement evaluation: <u>Head elevations in nearby wells producing from PRV are typically hundreds of feet above where these zones are encountered.</u> At the given locations, these aquifers are expected to reside at depths greater than 1500' below land surface, with resulting head expected to be less than 100' below land surface.

C2. **690-09-040** (2) (3): Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)	Hydrau Conne NO A	•	Potentia Subst. In Assum YES	terfer.
1	1	Canyon Creek	Unknown	2710- 2750	1145	\boxtimes			
2	2	Canyon Creek	Unknown	2710- 2750	2140	\boxtimes			\boxtimes
3	3	Canyon Creek	Unknown	2710- 2750	2330	\boxtimes			\boxtimes

Basis for aquifer hydraulic connection evaluation: It is unknown to what extent, if any, that groundwater in the deep PRV/CRBG aquifer contributes to surface water in this area.

Water Availability Basin the well(s) are located within: GRANDE RONDE R > SNAKE R - AB WILLOW CR

C3a. 690-09-040 (4): Evaluation of stream impacts for <u>each well</u> that has been determined or assumed to be **hydraulically** connected and less than 1 mile from a surface water source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that surface water source, and not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% natural flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked box indicates the well is assumed to have the potential to cause PSI.

Well	SW #	Well < 1/4 mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?

Application G-18825

Date: 06/17/2019

4

Page

C3b. **690-09-040 (4):** Evaluation of stream impacts by total appropriation for all wells determined or assumed to be **hydraulically connected and less than 1 mile** from a surface water source. **Complete only if Q is distributed among wells**. Otherwise same evaluation and limitations apply as in C3a above.

	W #	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
[

Comments:	This section does not apply.		

C4a. **690-09-040 (5):** Estimated impacts on **hydraulically connected surface water sources greater than one mile** as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.
