Groundwater Application Review Summary Form

Application # G- 18854	
GW Reviewer Travis Brown Date Review Completed: 9/23/2019	
Summary of GW Availability and Injury Review:	
Groundwater for the proposed use is either over appropriated, will not likely be available in the amounts requested without injury to prior water rights, OR will not likely be available within the capacity of the groundwater resource per Section B of the attached review form.	
Summary of Potential for Substantial Interference Review:	
[] There is the potential for substantial interference per Section C of the attached review form.	
Summary of Well Construction Assessment:	
The well does not appear to meet current well construction standards per Section D of the attareview form. Route through Well Construction and Compliance Section.	ched
This is only a summary. Documentation is attached and should be read thoroughly to understand to basis for determinations and for conditions that may be necessary for a permit (if one is issued).	the

B. GROUNDWATER AVAILABILITY CONSIDERATIONS, OAR 690-310-130, 400-010, 410-0070

Dogod upon available data. I have determined that aroundwaters for the arranged

period	r appropriated, \square is not over appropriated, $or \boxtimes$ cannot be determined to be over appropriated during any of the proposed use. * This finding is limited to the groundwater portion of the over-appropriation nination as prescribed in OAR 690-310-130;
determ	•
	ot or will likely be available in the amounts requested without injury to prior water rights. * This finding ted to the groundwater portion of the injury determination as prescribed in OAR 690-310-130;
c. 🗌 will r	ot or will likely to be available within the capacity of the groundwater resource; or
i. [2 ii. [f properly conditioned, avoid injury to existing groundwater rights or to the groundwater resource: The permit should contain condition #(s)7i (Willamette basalt condition), large water use reporting The permit should be conditioned as indicated in item 2 below. The permit should contain special condition(s) as indicated in item 3 below;
B2. a. Cond	ition to allow groundwater production from no deeper than ft. below land surface;
b. Cond	ition to allow groundwater production from no shallower than ft. below land surface;
ground	tion to allow groundwater production only from the CRBG dwater reservoir between approximately ft. and ft. below arface;
to occ issuan	reconstruction is necessary to accomplish one or more of the above conditions. The problems that are likely are with this use and without reconstructing are cited below. Without reconstruction, I recommend withholding ce of the permit until evidence of well reconstruction is filed with the Department and approved by the dwater Section.
	e injury –as related to water availability– that is likely to occur without well reconstruction (interference water rights, not within the capacity of the resource, etc):

B3. Groundwater availability remarks: Groundwater for the proposed use cannot be determined to be over-appropriated due to insufficient available data regarding rates of recharge and the current quantity of groundwater withdrawals from the aquifer system.

The proposed POA are most likely completed in the bottom of the Winter Water Member of the Columbia River Basalt Group (CRBG), near its contact with the underlying marine sedimentary unit (Beeson and Tolan, 2001). Aquifers within the CRBG generally occur in relatively thin porous and permeable zones at the contacts between lava flows. The aquifers are generally confined by thick flow interiors that typically have very low porosity and permeability (Conlon et al., 2005; Gannett and Caldwell, 1998).

Geologic maps of this area show a significant fault (the "Plank Hill Fault") ~1,400 ft northeast of the proposed POA 2 (Beeson and Tolan, 2001; Tolan and Beeson, 2000). Due to the geometry of the CRBG aquifers (thin and tabular), faults may act as hydraulic barriers. Additionally, the proposed POA are near the mapped, eroded edge of the CRBG in this area, which also represents a boundary of the CRBG aquifer(s) (Beeson and Tolan, 2001). Hydraulic barriers, such as the "Plank Hill Fault" and aquifer boundary, will limit groundwater availability and exacerbate well-to-well interference.

Nearby water level monitoring within the CRBG aquifer(s) does not indicate progressive or widespread declines (see Hydrographs, attached). Groundwater supplies would therefore appear to be adequate for existing users. However, additional pumping may lead to rapid declines within the aquifer. Furthermore, the available observation wells are more than 0.5 miles away from the proposed POA. In the faulted and eroded terrain of the South Salem Hills, aquifer conditions may be expected to change substantially over short distances. The South Salem Hills Groundwater Limited Area has been designated to address the sensitivity of these aquifers to pumping.

The nearest groundwater users to the proposed POA are MARI 63710, ~280 ft northwest of POA 1 and ~670 ft southwest of POA 2, and MARI 59485, ~500 ft east of POA 1 and ~570 ft south of POA 2. Both MARI 63710 and MARI 59485 are exempt domestic wells. To assess the degree of drawdown, analyses were conducted for the proposed use using the Theis equation for drawdown in a confined aquifer (see attached Theis Drawdown Analyses). Results indicate that the proposed use could cause well-to-well interference with MARI 63710 and MARI 59485 to exceed 15 ft of drawdown within less than 1 week of continuous operation at the maximum proposed rate (0.0935 cfs or ~42 gpm), which would require curtailment of

Application G-18854

the proposed use per Condition 7i, above. Therefore, it would appear that groundwater for the proposed use will not likely be available in the amounts requested without injury to prior water rights.

Date: 9/23/2019

The conditions detailed in B1(d)(i) and B2(c), above, are recommended for any permit issued pursuant to this application in order to protect the groundwater resource and senior users. In addition, the following Special Conditions should be applied:

- 1. <u>Best management practices shall be used to maximize the efficiency of water use. Drip irrigation or low-pressure sprinklers shall be used.</u> Use shall be limited to one acre-foot per acre per year.
- 2. The wells shall be continuously cased and continuously sealed to at least 240 feet below land surface (bls), or as approved by a Department hydrogeologist.
- 3. The wells shall be open to a single aquifer in the Winter Water Unit of the Grande Ronde Basalt Formation in the Columbia River Basalt Group and shall meet applicable well construction standards (OAR 690-200 and OAR 690-210). In addition, the open interval shall be no greater than 100 feet. However, a larger open interval may be approved by the Department if the applicant can demonstrate to the satisfaction of the Department that each well is only open to a single aquifer. Following well completion, the well shall be thoroughly developed to remove cuttings and drilling fluids. Substantial evidence of a single aquifer completion may be collected by video log, downhole flowmeter, water chemistry and temperature, or other downhole geophysical methods approved by the Department. These methods shall characterize the nature of the basalt rock and assess whether water is moving in the borehole. Any discernable movement of water within the well bore when the well is not being pumped shall be assumed as evidence of the presence of multiple aquifers in the open interval.
- 4. A dedicated water-level measuring tube shall be installed in the production wells. The measuring tube shall meet the standards described in OAR 690-215-0060. When requested, access to the well shall be provided to Department staff in order to make water-level measurements.
- 5. Copies of all geologic and hydrogeologic reports completed for the permittee during the development of the wells, including geophysical well logs and borehole video logs, shall be provided to the Department. Except for borehole video logs, two paper copies, or a single electronic copy, shall be provided of each report. Digital tables of any data shall be provided upon request.
- For any well operated under a permit issued pursuant to this application, a constant-rate aquifer test shall be conducted before beneficial use of the well begins to determine aquifer properties and to assess the potential impacts from use of the well. The test shall be designed and conducted by an Oregon Registered Geologist and the test design shall be subject to the approval of the Groundwater Section of the Department prior to the test. At a minimum, the test shall include discharge and water-level measurements in the pumping well and simultaneous water-level measurements in all other wells operated under this water right. Simultaneous water-level measurements shall also be made in MARI 63710 and MARI 59485. The applicant will be responsible for obtaining permission from the owners of MARI 63710 and MARI 59485 to monitor the wells throughout the aquifer test. Additionally, water-level measurements shall be made at a minimum of one observation well that is constructed to a similar bottom elevation as the pumping well and with a similar open interval. The observation well shall be at least 500 feet from the production well. Pumping duration for the test shall be determined by the Groundwater Section of the Department after well yield and specific capacity are determined. The requirement for a constant-rate aquifer test on each well may be waived if a multiple-well aquifer test is performed involving all permitted wells on this water right within five years of the date of permit issuance. The results of each aquifer test shall be presented in a report to the Department that includes an analysis of aquifer properties, aquifer boundaries, and the potential impact on nearby wells that is likely to occur over the duration of an irrigation season if the well is used at the proposed rate and duty. The permittee shall allow Department staff access to install water-level monitoring equipment for the duration of this permit.

NOTE: Both of the proposed POA are inadequately constructed based on these conditions. Authorized use of these POA as proposed would require reconstruction or abandonment and replacement of the existing wells.

C. GROUNDWATER/SURFACE WATER CONSIDERATIONS, OAR 690-09-040

C1. **690-09-040** (1): Evaluation of aquifer confinement:

Well	Aquifer or Proposed Aquifer	Confined	Unconfined
1	CRBG (Winter Water)	\boxtimes	
2	CRBG (Winter Water)	\boxtimes	

Basis for aquifer confinement evaluation: The water well reports for the proposed POA and nearby wells indicate static water levels above the applicable water-bearing zones. Based on the available evidence, the aquifer is confined.

C2. **690-09-040** (2) (3): Evaluation of distance to, and hydraulic connection with, surface water sources. All wells located a horizontal distance less than ¼ mile from a surface water source that produce water from an unconfined aquifer shall be assumed to be hydraulically connected to the surface water source. Include in this table any streams located beyond one mile that are evaluated for PSI.

Well	SW #	Surface Water Name	GW Elev ft msl	SW Elev ft msl	Distance (ft)	Hydraulically Connected? YES NO ASSUMED	Potential for Subst. Interfer Assumed? YES NO	r. O
1	1	Unnamed tributary to	~720-670	~700-480	~1,760			\boxtimes
		Croisan Creek						
1	2	Pettijohn Creek	~720-670	~465-215	~3,310			\boxtimes
1	3	Croisan Creek	~720-670	~630-560	~4,200			
2	1	Unnamed tributary to	~720-670	~700-480	~1,760			\boxtimes
		Croisan Creek						
2	2	Pettijohn Creek	~720-670	~465-215	~3,000			\boxtimes
2	3	Croisan Creek	~720-670	~630-560	~4,610			\overline{X}

Basis for aquifer hydraulic connection evaluation: The perennial reach of Pettijohn Creek (SW 2) heads within marine sediments, outside of the mapped boundary of the local CRBG units (Beeson and Tolan, 2001; USGS, 2017a). Therefore, a viable pathway does not appear to exist for hydraulic connection between the CRBG aquifer(s) and Pettijohn Creek.

Numerous mapped springs, some with water rights, do appear to emerge from the exposures and contacts of CRBG units (Beeson and Tolan, 2001). The perennial reach of SW 1 (Unnamed tributary to Croisan Creek) is mapped as heading within the outcrop/subcrop of the Winter Water unit southeast of the proposed POA (Beeson and Tolan, 2001; USGS, 2017a). The estimated surface water elevations for SW 1 and SW 3 (Croisan Creek) are coincident with or below the static water levels reported for POA 1 and 2. Furthermore, both SW 1 and SW 3 have incised below the elevation of the water-bearing zones noted in the logs for MARI 14751 (~561 ft bls) and MARI 14754 Based on the available evidence, the proposed POA are hydraulically connected to SW 1 and SW 3.

Water Availability Basin the well(s) are located within: <u>SW 1-3: WILLAMETTE R > COLUMBIA R - AB MILL CR AT</u>
<u>GAGE 14191000 (WID #183)</u>

C3a. 690-09-040 (4): Evaluation of stream impacts for each well that has been determined or assumed to be hydraulically connected and less than 1 mile from a surface water source. Limit evaluation to instream rights and minimum stream flows that are pertinent to that surface water source, and not lower SW sources to which the stream under evaluation is tributary. Compare the requested rate against the 1% of 80% natural flow for the pertinent Water Availability Basin (WAB). If Q is not distributed by well, use full rate for each well. Any checked box indicates the well is assumed to have the potential to cause PSI.

Well	SW #	Well < 1/4 mile?	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
1	1						3,620		*	
1	3						3,620		*	
2	1						3,620		*	
2	3						3,620		*	

C3b. **690-09-040 (4):** Evaluation of stream impacts by total appropriation for all wells determined or assumed to be hydraulically connected and less than 1 mile from a surface water source. **Complete only if Q is distributed among wells.** Otherwise same evaluation and limitations apply as in C3a above.

1 3,620 *	SW #	Qw > 5 cfs?	Instream Water Right ID	Instream Water Right Q (cfs)	Qw > 1% ISWR?	80% Natural Flow (cfs)	Qw > 1% of 80% Natural Flow?	Interference @ 30 days (%)	Potential for Subst. Interfer. Assumed?
3,620 *	1								

Date: 9/23/2019

Comments: * No appropriate analytical model is available for assessing depletion of these surface water sources due to pumping of the CRBG aquifer(s). However, it may be reasonably assumed, based on the typical behavior of basalt interflow aquifers, that the effects of pumping will propagate rapidly to the aquifer boundaries. Because of the proximity of the proposed POA to multiple hydraulic barriers – specifically the aquifer outcrop/boundary and nearby faults – the effects of pumping will be further exacerbated.

C4a. **690-09-040 (5):** Estimated impacts on **hydraulically connected surface water sources greater than one mile** as a percentage of the proposed pumping rate. Limit evaluation to the effects that will occur up to one year after pumping begins. This table encompasses the considerations required by 09-040 (5)(a), (b), (c) and (d), which are not included on this form. Use additional sheets if calculated flows from more than one WAB are required.

D. WELL CONSTRUCTION, OAR 690-200

D1.	Well #:1 & 2 Logid:MARI 14751 & MARI 14754
D2.	THE WELL does not appear to meet current well construction standards based upon: a. review of the well log; b. field inspection by
D3.	THE WELL construction deficiency or other comment is described as follows: Inadequate seal: Both wells are only cased and sealed to 49 ft bls. Target water-bearing zones, however, begin at 315 and 298 ft bls, respectively, as noted in the well logs. The intervening depths are described as "Badly Weathered Basalt" and "Badly Weather Vescular (sic) Basalt, Broken, Caving". Per OAR 690-210-0150, the acceptable methods for sealing of water supply wells in consolidated formation require that unperforated, permanent well casing be sealed into "at least five feet [of] solid, unfractured, consolidated rock overlying the water-bearing rock formation." Current construction of MARI 14751 and MARI 14754 may allow for leakage of groundwater and aquifer pressure, having a detrimental effect on water levels within the aquifer.
D4.	Route to the Well Construction and Compliance Section for a review of existing well construction.

Theis Drawdown Analyses

Projected Well-to-Well Interference with MARI 63710

Distance to Barrier/Boundary (aquifer boundary/contact) from Pumping Well (x):

POA 1 (MARI 14751) = 820 ft

 $POA\ 2\ (MARI\ 14754) = 600\ ft$

Distance from Pumping Well to Affected Well (MARI 63710) (x,y):

POA 1 (MARI 14751) = 400 ft, -260 ft

POA 2 (MARI 14754) = 0 ft, 675 ft

Pumping Rate (Q):

POA 1 (MARI 14751) = 18 gpm [proposed rate]

POA 2 (MARI 14754) = 24 gpm [proposed rate]

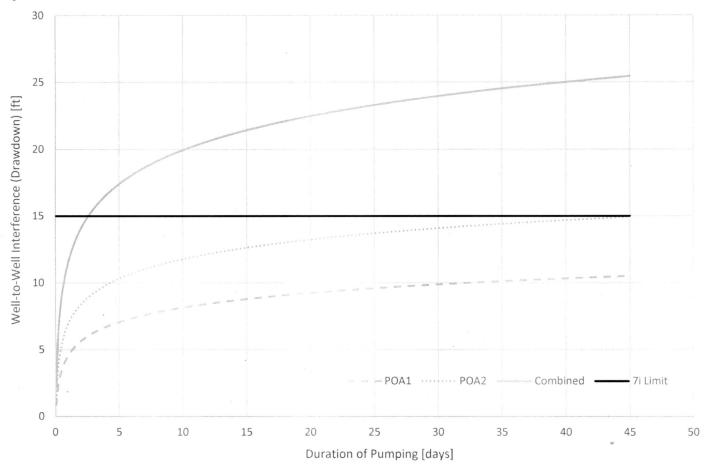

Aquifer Transmissivity (T) = $2,618 \text{ gpd/ft} (350 \text{ ft}^2/\text{day})$ [based on data from nearby pumping tests]

Aguifer Storativity (S) = $7x10^{-5}$ [MARI 65954 aguifer test]

Total Pumping Time = 45 days [time to reach maximum annual volume, 8.4 af/year]

Theis Drawdown Analysis (cont.)

Projected Well-to-Well Interference with MARI 59485

Date: 9/23/2019

Distance to Barrier/Boundary (aquifer boundary/contact) from Pumping Well (x):

POA 1 (MARI 14751) = 820 ft

POA 2 (MARI 14754) = 600 ft

Distance from Pumping Well to Affected Well (MARI 59485) (x,y):

POA 1 (MARI 14751) = -320 ft, -340 ft

POA 2 (MARI 14754) = -530 ft, 240 ft

Pumping Rate (Q):

POA 1 (MARI 14751) = 18 gpm [proposed rate]

POA 2 (MARI 14754) = 24 gpm [proposed rate]

Aquifer Transmissivity (T) = $2,618 \text{ gpd/ft} (350 \text{ ft}^2/\text{day})$ [based on data from nearby pumping tests]

Aquifer Storativity (S) = $7x10^{-5}$ [MARI 65954 aquifer test]

Total Pumping Time = 45 days [time to reach maximum annual volume, 8.4 af/year]

MEMO

To: Kristopher Byrd, Well Construction and Compliance Section Manager

From: Joel Jeffery, Well Construction Program Coordinator

Subject: Review of Water Right Application G-18854

Date: January 23, 2020

The attached application was forwarded to the Well Construction and Compliance Section by Water Rights. Travis Brown reviewed the application. Please see Travis's Groundwater Review and the Well Logs.

Applicant's Well #1 (MARI 14751): Based on a review of the Well Report, Applicant's Well #1 does not appear to comply with current minimum well construction standards (See OAR 690 Division 210). The problem is that the casing and seal is not to the appropriate depth. The well report indicates that the well is cased and sealed to a depth of 49 feet below land surface. In order to meet minimum well construction standards, the well must be continuously cased and continuously sealed to a minimum depth of 196 feet below land surface.

My recommendation is that the Department **not issue** a permit for Applicant's Well #1 (MARI 14751) unless it is brought into compliance with current minimum well construction standards, or information is provided to show that it is in compliance with current minimum well construction standards.

Applicant's Well #2 (MARI 14754): Based on a review of the Well Report, Applicant's Well #2 does not appear to comply with current minimum well construction standards (See OAR 690 Division 210). The problem is that the casing and seal is not to the appropriate depth. The well report indicates that the well is cased and sealed to a depth of 46 feet below land surface. In order to meet minimum well construction standards, the well must be continuously cased and continuously sealed to a minimum depth of 193 feet below land surface.

My recommendation is that the Department **not issue** a permit for Applicant's Well #2 (MARI 14754) unless it is brought into compliance with current minimum well construction standards, or information is provided to show that it is in compliance with current minimum well construction standards.

Note: Travis Brown's Groundwater Application Review states that to satisfy any hydraulic connection issues, Applicant's Wells #1 and #2 "shall be continuously cased and continuously sealed to at least of 240 below land surface or as approved by a Department hydrogeologist." These requirements exceed the minimum well construction standards.
