

**Willamette River Basin Water Optimization Study  
Oregon**

**Willamette River Basin  
DAM SITE REVIEW**

**Oregon Water Resources Department  
and  
Bureau of Reclamation  
February 1991**

## Introduction

The various public involvement activities being conducted by the Oregon Water Resources Department in the Willamette River basin resulted in input from the public on numerous water and related land problems and needs. Potential solutions to solve (1) minimum streamflows for fish and water quality, (2) reduce stream pollution from point and non-point sources, and (3) more efficiently use existing water supplies will involve reallocation of water supplies, expansion of existing supplies, and development of potential surface and ground-water supplies. Improved conservation practices and nonstructural solutions are being emphasized as a means to solve the problems and meet the needs. However, it has become apparent that structural solutions will also have to be considered, especially for problem areas located west of the Willamette River.

This dam site review provides information on existing facilities and potential dam and reservoir sites within the Willamette River basin. Due to the large number of existing and potential storage sites identified through the inventory, it was decided to limit the report to those sites with an active storage capacity of 10,000 acre-feet or greater (one exception was included because it is part of a two dam system). The reporting effort culminated in development of a map that shows the location of existing dams and reservoirs and previously identified potential dam sites (see map).

## Literature Search

Available reference materials were searched for information that could provide either the required data or sources referring to dam and reservoir information. Reference sources included files of the U.S. Army Corps of Engineers, North Pacific Division and Portland District Offices; Oregon Water Resources Department; City of Eugene; City of Portland; irrigation and other water project operation offices within the Willamette River basin; Bureau of Reclamation offices, Public Library (Denver, Colorado); and other sources. The search included correspondence files, brochures, reports, and other publications. Telephone calls were made to the various entities to obtain information not available from other sources.

## Existing Storage Facilities

The Corps of Engineers has constructed an extensive storage system in the basin consisting of 13 major and 3 reregulating dams and reservoirs. The Bureau of Reclamation has constructed a storage reservoir on a tributary of the Tualatin River. The city of Eugene and Portland Gas and Electric Company have each constructed a storage facility in the basin.

Data on a total of 16 existing storage facilities are summarized in Table A; this includes a reregulating dam with a storage capacity of less than 10,000 acre-feet. Reregulating dams are usually located just downstream from a larger storage reservoir and help regulate and control discharges.

Storage allocations are summarized in Table B. The major allocation is for irrigation and most of this remains uncontracted.

US	Miscellaneous contracts downstream of all reservoirs		5,348					
	TOTAL	1,623,200	73,251	10,300	13,400	1,565,579	2,010,000	2,590,000

<sup>1</sup>EUGENE=City of Eugene, PGE=Portland Gas and Electric Co., US=Federal, USBR=Bureau of Reclamation, USCE=Corps of Engineers  
<sup>2</sup>The water service contractors' annual water supply comes from natural river flows and Henry Hagg Lake storage. Each entity receives natural flows first and these are supplemented with storage from Henry Hagg Lake to make up the total delivery.

## Potential Storage Facilities

A total of 37 potential dam and reservoir sites were identified in the Willamette River basin. This includes modification of existing Dorena Dam to increase the storage capacity. Many of these sites have been previously studied by the Corps of Engineers, Bureau of Reclamation, and Soil Conservation Service. Table C summarizes the data for sites with a potential storage capacity greater than 10,000 acre-feet.
